

REQUIREMENTS OF THE PROJECT

EMPLOYEE MANAGEMENT SYSTEM

SYSTEM DEVELOPMENT LIFE CYCLE

This project is based of **Employee Management System**.

Employee management system is a program built to handle the primary house keeping functions of a company. This software helps companies keep a track of all employees and their records. It is used to manage and organize a company using a computerized system.

Employee management system enables employers to gain an insight of their employees, which allows them to better plan and manage work hours, lowering expenses and increasing productivity. One can use this program to perform basic employee record functions such as adding employee information, viewing newly added employees, searching for employees, and so on.

STRENGTHS:

Employee management system enables an user to enter a username and password. Each employee is associated with a unique password which makes it secure and free from illegal leaking of employee details.

WEAKNESS:

The developed program has no option of changing the password of an employee. The privacy rights of employees will be at risk if a security breach allows access to private information. This could result in legal violations, such as identity theft.
